

GETTING STARTED

Provectus Analytics

This is a small program that turns your Flight Schedule Pro reports into charts and tables — average cost per rating, hours per student, how long each rating takes, and so on. It runs entirely on your Mac. Nothing leaves your computer.

First time you open it

- 1 Find the **Provectus Analytics** folder you were given. (If it came as a zip file, double-click the zip first — it'll create the folder.)
- 2 Open the folder. Inside, find a file called **Provectus.command**.
- 3 **Right-click** on Provectus.command (or hold Control and click) → choose **Open** from the menu.
- 4 Your Mac will show a warning that says something like “*Apple cannot check it for malicious software.*” Click **Open** anyway. (This only happens the first time.)
- 5 A black Terminal window opens. It will say “*installing dependencies...*” for 1–2 minutes. This is normal.
- 6 When it's done, your web browser opens automatically and shows the dashboard. You're in.

Important: leave the Terminal window open while you use the dashboard. Closing it stops the program.

Every other time

Just **double-click** Provectus.command. No right-click needed anymore. The browser opens to the dashboard in a few seconds.

When you're done

Close the Terminal window. That's it. The browser tab can stay open — it just won't work until you launch the program again.

Updating the data

The dashboard reads four spreadsheets from inside the **Provectus Analytics** folder. Each one comes from a different place:

File on your computer	Comes from
synthetic_fsp_clients.csv	Flight Schedule Pro → Sales by Client
synthetic_fsp_reservations.csv	Flight Schedule Pro → Reservation Detail
synthetic_fsp_invoices.csv	Flight Schedule Pro → Invoice Detail
synthetic_alumni_survey.csv	Google Form → Responses → Download CSV

To replace the data:

- 1 Download the new spreadsheets from FSP and the Google Form.
- 2 Replace the four files inside the **Provectus Analytics** folder. Keep the exact same filenames.
- 3 If the dashboard is open: in the dark sidebar on the left, click the **Rebuild DB** button. Then reload the browser tab.
- 4 If the dashboard isn't open: just launch it again. It picks up the new files automatically.

Right now the files have “synthetic_” in their names because they're test data. When real Provectus exports arrive, Olsen will either rename the files or update the program to use real names.

If something goes wrong

The browser didn't open.

Open your browser yourself and type **127.0.0.1:8050** in the address bar.

The Mac says “Python 3 is not installed.”

Install Python from python.org/downloads/macOS, then try again.

The Terminal says “port already in use.”

Another copy of the program is already running. Close the older Terminal window, then try again.

The dashboard shows the wrong numbers after I replaced the CSVs.

Click **Rebuild DB** in the sidebar, then reload the page.

Anything else.

Take a screenshot of the Terminal window and send it to Olsen — that's where errors show up.

Light mode and dark mode

Bottom of the dark sidebar, click the **Theme** button to toggle between light and dark. Your choice is remembered next time.

Questions, anything broken, anything confusing — text Olsen.
